Arrangement of Electrons in Atoms SECTION 3 SHORT ANSWER Answer the following questions in the space provided. 1. State the Pauli exclusion principle, and use it to explain why electrons in the same orbital must have opposite spin states. The Pauli exclusion principle states that no two electrons in an atom may have the same set of four quantum numbers.

Each orbital may contain at most (two, four) electrons. 16. All s orbitals are (spherically shaped, dumbbell shaped). . A principal energy has (n, '12) energy sublevels. The maximum number of (electrons, orbitals) related to each principal energy level equals $2n^2$. There are (three, five) equal energy p orbitals.

You can use the atomic number & atomic mass to help you find the number of protons, electrons, & neutrons: # of protons - use the atomic number # of electrons - is always the same as the number of protons, so you can also use the atomic number # of neutrons - round the atomic mass, and then subtract atomic mass - atomic number The number of protons & electrons will always be the same, but the number of neutrons can be different.
