Chemistry Revision Notes~~

Litmus paper is a type of pH paper made by treating the paper with natural dyes from lichens.

The litmus test is performed by placing a small drop of sample onto the colored paper. Usually, litmus paper is either red or blue.

Red paper turns blue when the pH is alkaline, while blue paper turns red when the pH turns acidic.

doesn't bleach it red. The word 'bleach' is used to show that the colour is being lost, i.e. it is turning white. HOCl is the bleach in the reaction. The reason why it bleaches organic matter probably is due to loss of conjugation because of addition reactions occurring when the H-OCl meets a double bond.

The main use of litmus is to test whether a solution is acidic or basic. Light Blue litmus paper turns red under acidic conditions and red litmus paper turns blue under basic or alkaline conditions, with the color change occurring over the pH range 4.5–8.3 at 25 °C (77 °F). Neutral litmus paper is purple. Litmus can also be prepared as an aqueous solution that functions similarly.
